

200 cable tray tee dimensions

AI Overview

A 200 cable tray tee typically has a length of 2500mm or 3000mm, consistent with standard cable tray sections. Standard Dimensions Cable tray tees are designed to match the main tray sections in length to ensure proper alignment and structural integrity. For a 200mm wide tray, the tee length is generally standardized to 2500mm or 3000mm, depending on manufacturer and project requirements. The width of the tee branches (W1 and W2) corresponds to the main tray width, which in this case is 200mm, while the height and depth are selected based on load capacity and cable fill requirements. Types and Materials Cable tray tees can be equal or unequal, meaning the branch widths can be the same or different from the main run. They are available in mild steel (pre-galvanized or hot-dip galvanized) and stainless steel (316L), with optional ventilated or closed covers. The material choice affects durability, corrosion resistance, and suitability for indoor or outdoor installations. Practical Considerations When planning installation: Ensure the tee length matches the main tray sections for seamless connection. Verify the load rating and material thickness to support the intended cable weight. Consider the branch orientation and whether an equal or unequal tee is required for your layout. By following these standards, a 200 cable tray tee will integrate properly with the rest of the cable management system, providing both structural support and adequate cable routing.
