

Distance between 35kV busbars and 6kV busbars

Overview

The NEC requires a minimum spacing of 12 inches (305 mm) between busbars, but this can be reduced based on the busbar current and configuration. Formula for Calculating Busbar Spacings: $\text{Spacing} = (\text{Busbar Current} / 100) * 1$. It is a direct path to arc ignition, insulation tracking, dielectric failure, and avoidable downtime in low-voltage assemblies. IEC 61439 treats clearance and creepage as verification issues because they sit at the center of insulation. From time to time we are asked what bus spacings are required by ANSI standards for switchgear. Those who ask are frequently surprised by the answer: None. Engineers working on switchgear, substations, panel boards, and industrial distribution systems must. The design of safe distances between high-voltage busbars is critical to ensuring equipment performance and operational safety. " And for general industrial control equipment, voltage range 301-600, shortest distance is shown as 1/2" with this same value being shown through oil or air over surface.
