

Distribution box three-level two-leaking

Overview

Connects to end-use equipment via switch boxes, forming a three-tier power distribution system. Residual current devices (RCDs) at both the tertiary (equipment-level) and secondary (zone-level) stages. Ensures safe disconnection in case of faults or leakage currents. The complete set of products can form a complete three-level protection system for construction electricity, achieving the goal of one machine, one switch, and one protection, which is very suitable for various standard engineering applications. After stepping down the voltage through the transformer's low-voltage side (0.4 kV), power distribution is achieved through three levels of distribution boxes: the main distribution board, secondary. Handles three-phase power and typically connects to secondary loads such as motors or machinery. Secondary Distribution Box: Also designed. Temporary power supply management at construction sites adopts a tiered distribution model. What we can do ?
