

Double-row complete distribution box

Overview

Galvanized double-row distribution boxes are components of mechanical ventilation systems, designed for air distribution in residential buildings. Made of INOX stainless steel, they are equipped with 14 or 16 Ø75 mm connectors arranged in two rows. The Ø198 mm main spigot can be positioned on the back, side, or top of the box. To meet all specifications (practices, speed of implementation, ease of maintenance, continuity of service, etc.), Legrand offers three types of solutions: "Standard" distribution, "Optimised" distribution and "Increased Safety" distribution. All these solutions. A distribution box is a low-voltage electrical enclosure that receives incoming power and distributes it safely to multiple outgoing circuits through protective and switching devices such as MCBs, RCDs, RCBOs, fuses, isolators, busbars, neutral bars, earth bars, and surge protective devices. With two rows of circuit breakers or fuses, these boxes offer higher capacity and better organization.
