

Galvanized Channel Straight-Through Cable Tray Supply

AI Overview

Galvanized channel-type straight-through cable trays are durable, corrosion-resistant steel trays designed to support and organize electrical cables in industrial and commercial installations.

Material and Corrosion Resistance Galvanized channel trays are typically made from carbon steel coated with zinc through hot-dip galvanization, which protects the steel from rust and environmental degradation by acting as a sacrificial anode. For extreme moisture, chemical, or marine environments, stainless steel trays may be preferred for superior corrosion resistance and longevity.

Tray Design and Configurations Straight-through channel trays feature a simple U-shaped cross-section, providing strength, accessibility, and ease of installation.

Bottom types: Solid for maximum protection or ventilated with perforations to allow airflow and prevent cable overheating.

Side rails often include longitudinal slots for tie-wraps, clamps, or brackets, facilitating precise cable management.

Sizes: Common widths include 25mm, 50mm, 75mm, 100mm, 150mm, and 200mm, but custom sizes are available depending on cable load and spacing requirements.

Load Capacity and Installation Considerations The tray width and thickness should be selected based on the number, size, spacing, and weight of cables. Supports may be required at intervals to maintain structural integrity, especially for long spans or heavy cable loads.

Ventilated trays improve thermal management, while solid trays offer better protection against dust, liquids, and mechanical impact.

Ordering and Suppliers Suppliers like Jiangsu Holdee Electric Co., Ltd provide galvanized, hot-dip galvanized, and coated steel trays with various widths and lengths, and can accommodate small trial orders with potential additional shipping or customs fees.

Other suppliers, such as TPMC Steel and Eurostrut, offer UL-listed channel trays wit...
