

How to install the wires under the distribution box

AI Overview

To install wires under a distribution box safely, strip the insulation, connect each wire to its designated terminal (line, neutral, ground), secure them tightly, and arrange the wires neatly for proper heat dissipation and future maintenance.

Preparation and Safety Before starting, ensure the power supply is completely turned off and verify with a voltage tester to prevent electric shock. Wear insulating gloves, safety glasses, and non-slip shoes for protection. Gather all necessary tools such as wire strippers, screwdrivers, cable ties, and a multimeter for testing.

Mounting the Distribution Box Select a suitable location: Keep the box away from water, flammable materials, and corrosive substances. For residential setups, install at about 1.5 meters above the ground; for industrial setups, adjust according to surrounding equipment. Fix the box: Mark the mounting points, drill holes, and secure the box with expansion bolts. Ensure it is level and stable. For outdoor installations, use a waterproof enclosure and consider a rain cover.

Wire Preparation Cut and strip wires: Remove the insulation to expose the conductor, leaving an appropriate length to avoid short circuits or poor contact.

Organize wires: Separate phase (live), neutral, and ground wires, and plan the routing to avoid tangling and ensure proper heat dissipation.

Terminal Connections Connect wires to terminals: Follow the color coding standard—phase to phase terminal, neutral to neutral terminal, and ground to ground terminal. Use a wire stripper or screwdriver to secure the wire tightly for good conductivity.

Install circuit breakers: Each circuit should have its own breaker or fuse according to the load requirements. Ensure the breaker ratings match the wire gauge and expected current.

Wiring Arrangement Neat layout: Arrange wires along the sides or designated cable entry points. Use cable ties to secure them and leave space for heat dissipation...
