

Installed on top of the mesh cable tray cabinet

AI Overview

Wire mesh cable trays can be securely installed on top of cabinets using appropriate supports, maintaining recommended clearances and fastening per manufacturer guidelines.

Support and Mounting Options

To mount a wire mesh cable tray on top of a cabinet, you can use several support methods:

- FASP Support:** Bolted directly to the cabinet for a straightforward installation.
- UFS Support Bracket or Elevated FASP:** If the tray needs to be raised above the cabinet, use a UFS bracket or FASP elevated with threaded rods to achieve the desired height.

Support Spacing: Wire mesh trays should be supported every 5 feet or less, with additional support within 2 feet of splices or intersections, and on both sides of any change in elevation.

Clearance Requirements

Proper clearances ensure safety, accessibility, and compliance:

- Maintain a minimum of 12 inches between the tray and the top of the cabinet or rack.
- Leave 12 inches between the tray and the ceiling or building truss structure.
- For multiple tiers of trays, maintain 12 inches between trays.
- When above an acoustical drop ceiling, maintain at least 3 inches above the ceiling tiles.

Fastening and Assembly

Secure the tray to each support with at least one fastener, following the manufacturer's recommended assembly and splice practices. Use manufacturer-recommended tools for cutting, bending, and forming intersections. Side-action bolt cutters with an offset head are commonly used for field modifications. Ensure the tray is level and properly aligned before tightening fasteners to prevent sagging or misalignment.

Additional Tips

Plan the layout in advance to avoid conflicts with other trades or structural elements. Label cables as you route them for easier maintenance. Use the tray's flexibility to create bends, risers, or custom assemblies without purchasing additional prefabricated components, which can save material a...
