

Remote Port Settings for Distribution Box

AI Overview

Remote port settings for a distribution box involve configuring server or switch ports to ensure secure and uninterrupted communication, with options for HTTP/HTTPS, VLAN, and remote management.

Distribution Server Port Configuration

For remote office distribution servers, the default communication ports are typically HTTP port 80 and HTTPS port 8383 for secure communication. To modify these ports:

- Navigate to Scope of Management (SoM) Settings in your management console.
- Select Modify under actions.
- In the Distribution Server Details section, enter the desired port numbers in the HTTP Port field. Enter the HTTPS Port only if secure communication is enabled.
- Click Modify to apply changes. After changing the port, the distribution server contacts the central server to update the new port numbers. Agents will not communicate with the distribution server until they fetch the updated port information, which occurs during the 90-minute refresh cycle or upon the next agent contact.

For zero-downtime migration, a dual-listener configuration can run old and new ports simultaneously, with a phased rollout and a 48-72 hour grace period to ensure all endpoints update correctly.

Network Switch Port Configuration (Legrand Distribution Box)

For a Legrand area distribution box switch, remote port settings involve configuring the switch for network traffic management:

- The switch typically has 6 Gigabit PoE+ ports and 1 SFP uplink port supporting fiber connections.
- Advanced features include VLAN, QoS, STP/RSTP, IGMP Snooping, and MAC-based network access control.
- Remote management is supported via SNMP, Web, and Telnet, allowing administrators to configure ports, monitor traffic, and apply security policies remotely.
- Power and PoE settings can be adjusted to ensure uninterrupted operation, with internal hot-swappable battery backup for critical deployments.

Best Practices

Document current port configurations and network paths before making changes. Test changes in a pilot group to validate connectivity and performance. Mai...
