

Short Circuit Calculation for Relay Protection Tester

Overview

Calculate pickup values, timing curves, coordination time intervals (CTI), and test injection currents for overcurrent (50/51), differential (87), distance (21), and directional (67) protective relays. Essential tool for relay technicians, protection engineers, and commissioning specialists. These calculations are critical in industrial. There are many requirements in the National Electrical Code® which pertain to overcurrent protection. In order to comply with these requirements there is certain information that must be known, such as the value of short-circuit current. A Short Circuit Calculator (short-circuit) for fault current estimation, available at </calculator/safety/short-circuit/>.
